The Effects of Lightning on Atmospheric Chemistry

- Approximately 77 million lightning bolts strike the U.S. annually
- Measurements show lightning generates Nitrous Oxides (NOx) as well as PAN, and HNO₃ in the atmosphere. NOx is a catalyst for creating Ozone:

$$\begin{array}{c} \mathsf{NO_2} + hv \longrightarrow \mathsf{O} + \mathsf{NO} \\ \mathsf{O} + \mathsf{O_2} + \mathsf{M} \longrightarrow \mathsf{O_3} + \mathsf{M} \\ \mathsf{OH} + \mathsf{CO} \longrightarrow \mathsf{H} + \mathsf{CO_2} \\ \mathsf{H} + \mathsf{O_2} + \mathsf{M} \longrightarrow \mathsf{HO_2} + \mathsf{M} \\ \mathsf{HO_2} + \mathsf{NO} \longrightarrow \mathsf{OH} + \mathsf{NO_2} \\ \hline \mathsf{CO} + 2\mathsf{O_2} + \mathsf{hv} \longrightarrow \mathsf{CO_2} + \mathsf{O_3} \end{array}$$

- PAN and HNO₃ are nitrogen reservoir species. HNO₃ consists of ~60-80% of the total increase in nitrogen species concentration due to lightning and is affected the most. PAN is ~20-30% of the nitrogen enhancement.
 - These species can move through the free troposphere and create NOx away from the lightning source
- NOx reacts with OH to form HNO₃ and directly affects the oxidizing capability of the atmosphere

The amount of NOx produced by lightning differs depending on where you look:

- Book: "lightning appears to be responsible for less than 10 % of the total NOx budget" pg 105
- NASA: during the summer months, lightning activity increases NOx by as much as 90 percent and ozone by more than 30 percent
 - over the United States lightning accounts for only about 5 percent of the total U.S. nitrogen oxide annual emissions and about 14 percent of the total emissions in July
- Atm Chem Phys Discuss: Recent global estimates of NOx production from lightning vary from 1 to 20 Tg (N)/yr though 5±3 Tg N/yr is applied in most global modeling (Tg = 1 million metric tonnes)

Lightning different from anthropogenic NOx emmisions:

- Anthro: emissions released close to surface, undergoes chemical reactions before being transported up
- Lightning: directly releases NOx to the free troposphere
